Model YCP-AS

## PRO SWITCHIE

Model YCP-PROAS

### Automatic Video and Audio Switchers

The **Auto Switchie** and the **Pro Switchie** from **Y/C Plus®** delivers an inexpensive solution for automatic switching of video with audio follow. The concept is simple, both the **Auto Switchie** and **Pro Switchie** switch both video and audio to the "B" Channel when ever a video input is detected. This allows applications such as FYI Cable Channels, In-House Communications Channels to insert video tape programs without requiring a on-site operator. When video is no longer detected on the "B" channel the **Auto Switchie** and the **Pro Switchie** routes the video and audio back to the "A" Channel.

When the primary video source is connected to the "B" channel, the **Auto Switchie** or the **Pro Switchie** can be used as a monitor for satellite downlinks or VCR's when a loss of signal occurs. The "A" Channel can be used as a standby video and audio source.

Both the **Auto Switchie** and **Pro Switchie** also offer a dry contact closure for alarm systems, such as a dialer for pagers or buzzers. An internal switch allows for the alarm to activated either on the "A" or "B" channels. The 3-pin plug is supplied.

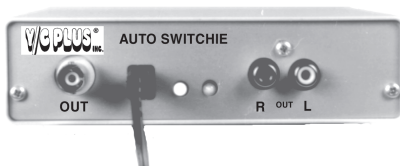

The LED will light when the units have switched to the alternate channel.

The **Auto Switchie** offers (2) two BNC composite video and (2) two RCA Stereo audio 10K ohm unbalanced inputs. The outputs are (1) one BNC composite video and (2) two audio stereo 10K ohm unbalanced and (1) contact closure.

The **Pro Switchie** offers the same composite video inputs and outputs. The **Pro Switchie** handles the audio in a different manner. The **Pro Switchie** single mono 600 ohm balanced XLR female inputs for each channel and the single 600 ohm balanced mono XLR male output for broadcast applications.

Both units are supplied with a 5V AC power supply and 3 pin modular plug for alarm interfacing.
